FULL PRODUCT TEARDOWN · 8 OCTOBER 2026

From job discovery to application *agent*.

Workflow, interface system, onboarding, automation logic, pricing, trust gaps, and the exact access boundary.

Verdict Strong product thinking. Not ready for blind trust.

The product is coherent. The trust contract is not.

Promising, differentiated, but not yet trustworthy enough for unattended use.

myjobb.ai has the most coherent end-to-end story of the job agents reviewed here: ranked discovery, explainable matching, tailored resumes, approval, application, follow-up, referrals, and outreach. Its activity ledger makes automation unusually visible.

01

Best idea: auditable agent

02

Biggest risk: forced live application

03

Commercial issue: conflicting pricing

What works

- Clear “agent” positioning rather than a generic job board.
- Explainable match deductions and provenance on answers.
- Distinctive cream, dark green, and lime interface system.
- Human approval is designed into the flow.

What blocks trust

- Full postal address, gender, disability, and sign-in password requested before value is proven.
- No dashboard preview until a real application is submitted.
- Public pages disagree on prices, limits, and auto-renew language.
- Major scale claims are not independently verifiable.

One agent attempts to own the whole application loop.

myjobb.ai calls itself “India’s first AI Job Agent.” It is presented as a 2026 product of Infyn Technologies Private Limited.

The job it promises to do

Continuously find relevant openings, tailor the candidate’s resume, ask for approval, submit applications, and manage recruiter responses.

The product boundary

It is not simply a feed or autofill extension. The pitch is an orchestration layer spanning jobs, resumes, applications, inbox, referrals, cold email, and scheduled automations.

Public entry points

https://myjobb.ai/
https://myjobb.ai/login-app

500K+
live jobs claimed

50K+
new jobs/day claimed

06:00
IST feed refresh

Claims above are marketing statements, not independently verified in this teardown.

Discovery becomes a controlled automation pipeline.

01 Google sign-in

02 Connect job boards

03 Rank and dedupe jobs

04 Tailor resume per role

05 Ask for approval

06 Submit forms

07 Track activity and opens

08 Route replies to inbox

09 Add referrals and outreach

Supported accounts named publicly

Naukri, LinkedIn, Foundit, Instahyre, Greenhouse, Ashby, Lever, Workday, and Hirist.

Decision surface

Match-% badges, matched-skill chips, Applicant Tracking System (ATS) score, keyword coverage, quantified-impact checks, and screening-answer provenance.

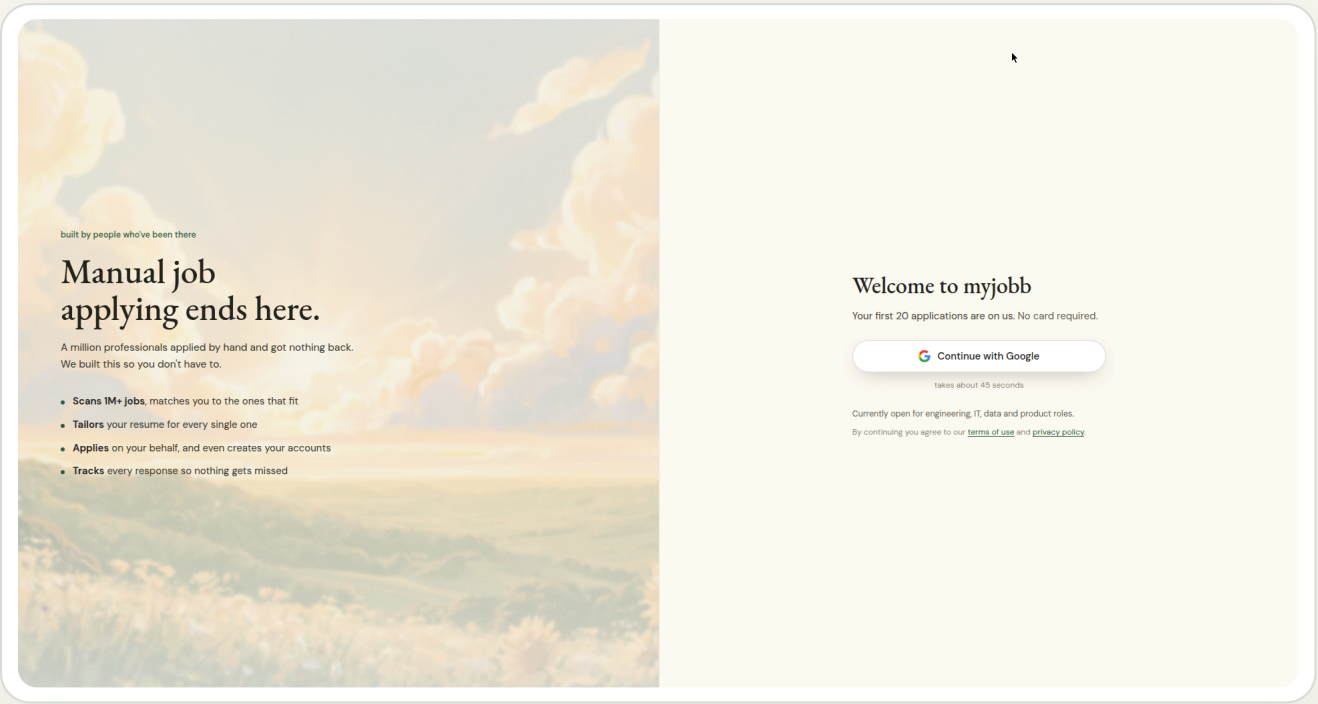

Human checkpoints

Approval in product or WhatsApp; low-confidence mandatory questions pause the run.

After submission

Timestamped application log, recruiter-open tracking, managed inbox, and WhatsApp updates for replies, interviews, and offers.

The account boundary is Google-only.

No email/password form exists. This is simpler, but the marketing navigation does not surface a clear Login link; it favors “Get early access.”

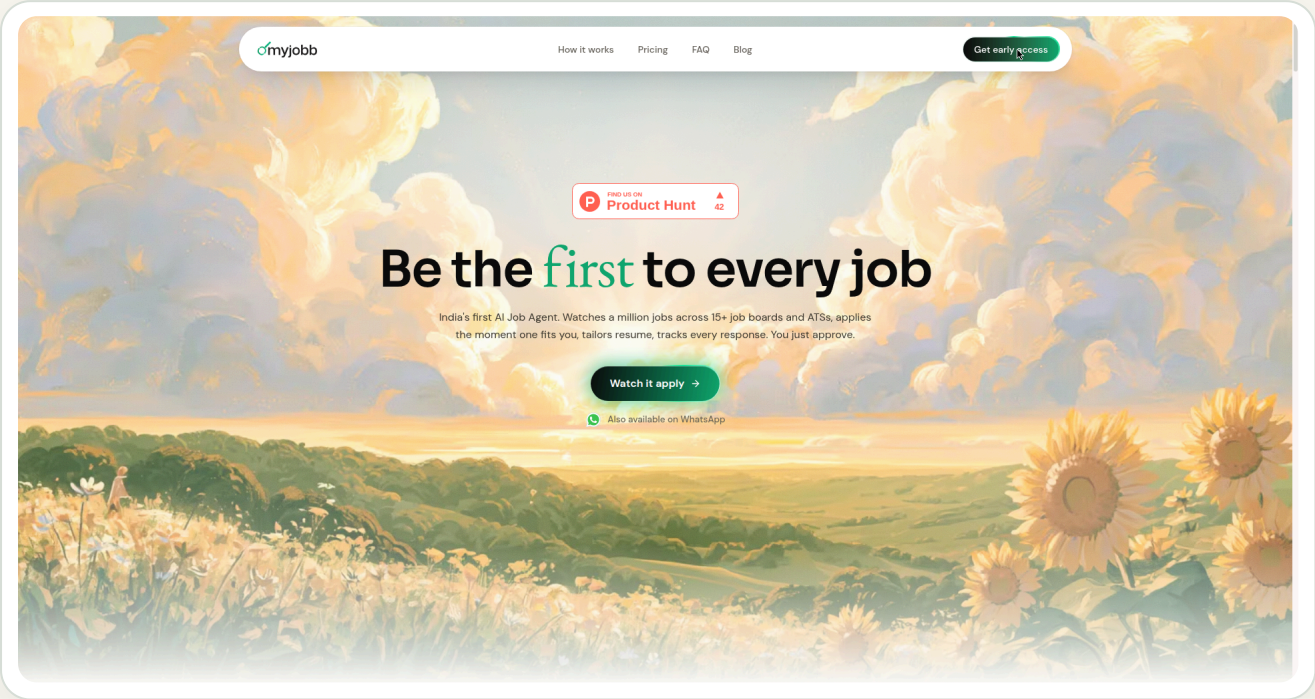

UI reading

- Google OAuth is the only route.
- No alternative credential flow was observed.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

The promise is emotional before it is technical.

A large serif headline, cream field, lime CTA, soft organic background, and browser-framed product visuals make the landing page feel consumer-friendly rather than enterprise-heavy.

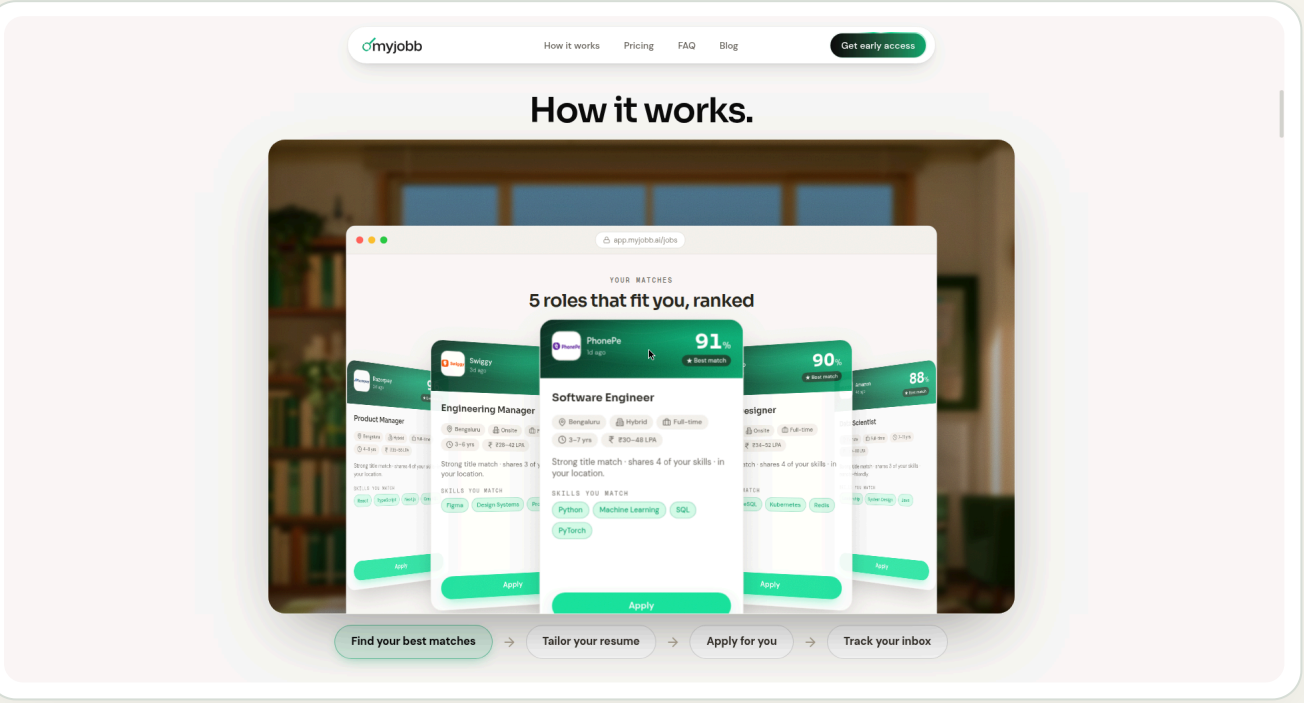

UI reading

- Floating pill navigation.
- High-contrast green CTA.
- Serif italic emphasis humanizes the automation pitch.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

The mockup sells relevance, not volume.

The ranked feed uses match percentages, “Best match” labels, and matched-skills chips. It is the first public glimpse of the product’s internal information architecture.

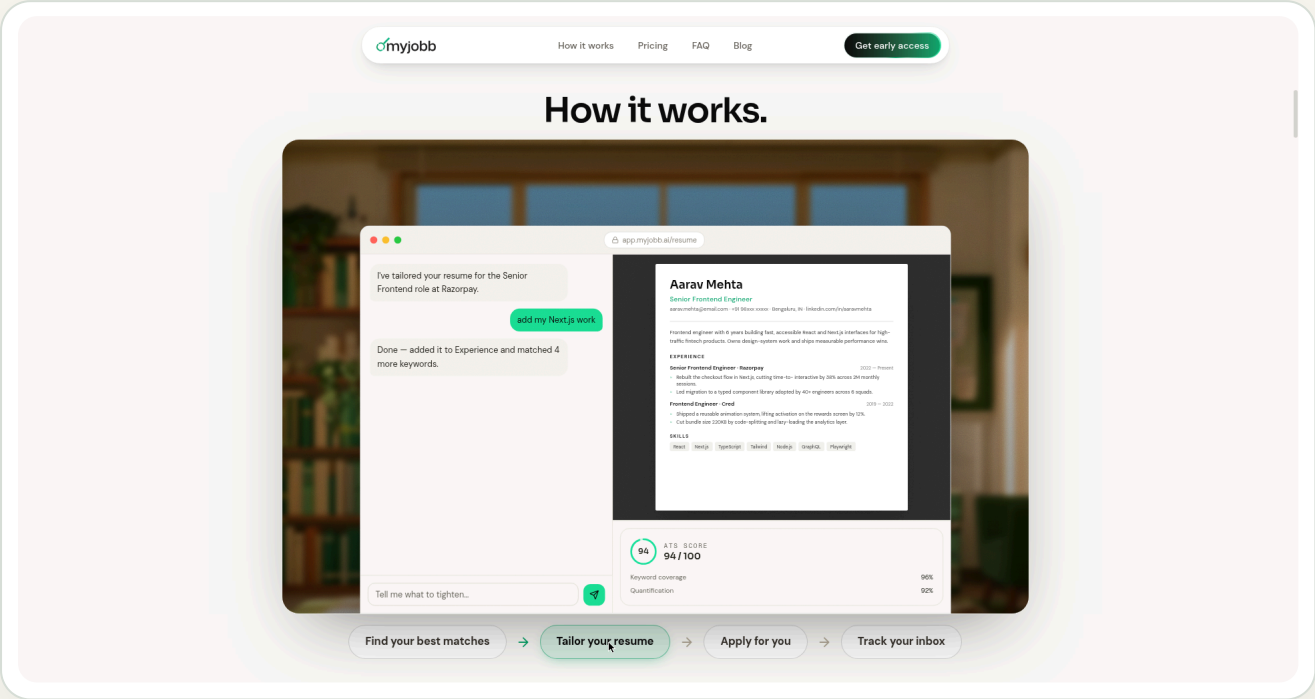

UI reading

- Jobs route shown inside app.myjobb.ai.
- Visual hierarchy prioritizes score, role, company, and evidence.
- Realistic browser frame is the strongest marketing device.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

Resume tailoring is framed as a measurable conversation.

The interface combines chat-like instructions with an ATS score, keyword coverage, and quantification checks. It turns an opaque generation task into visible criteria.

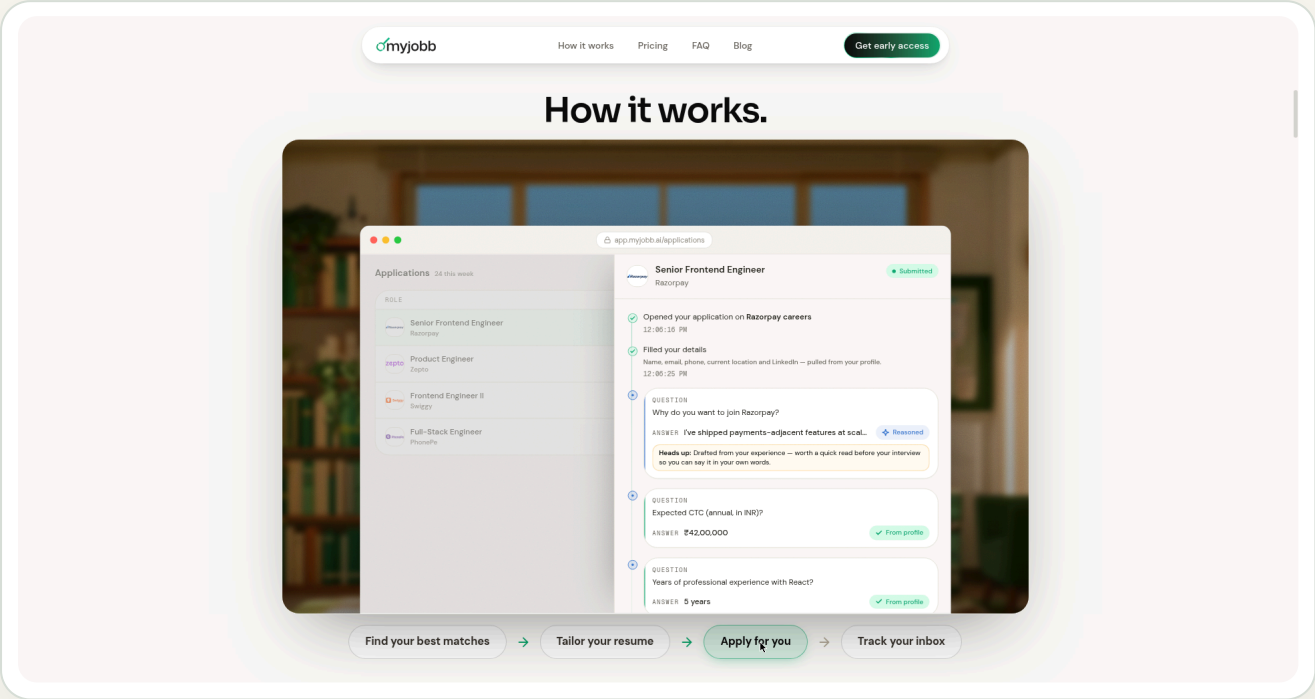

UI reading

- Resume route is a first-class workspace.
- Score and coverage provide progress feedback.
- Green is reserved for success and action.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

The agent exposes its work rather than hiding it.

The activity panel narrates reading the role, tailoring the resume, and applying. Screening answers are labelled “Reasoned” or “From profile,” which gives users provenance.

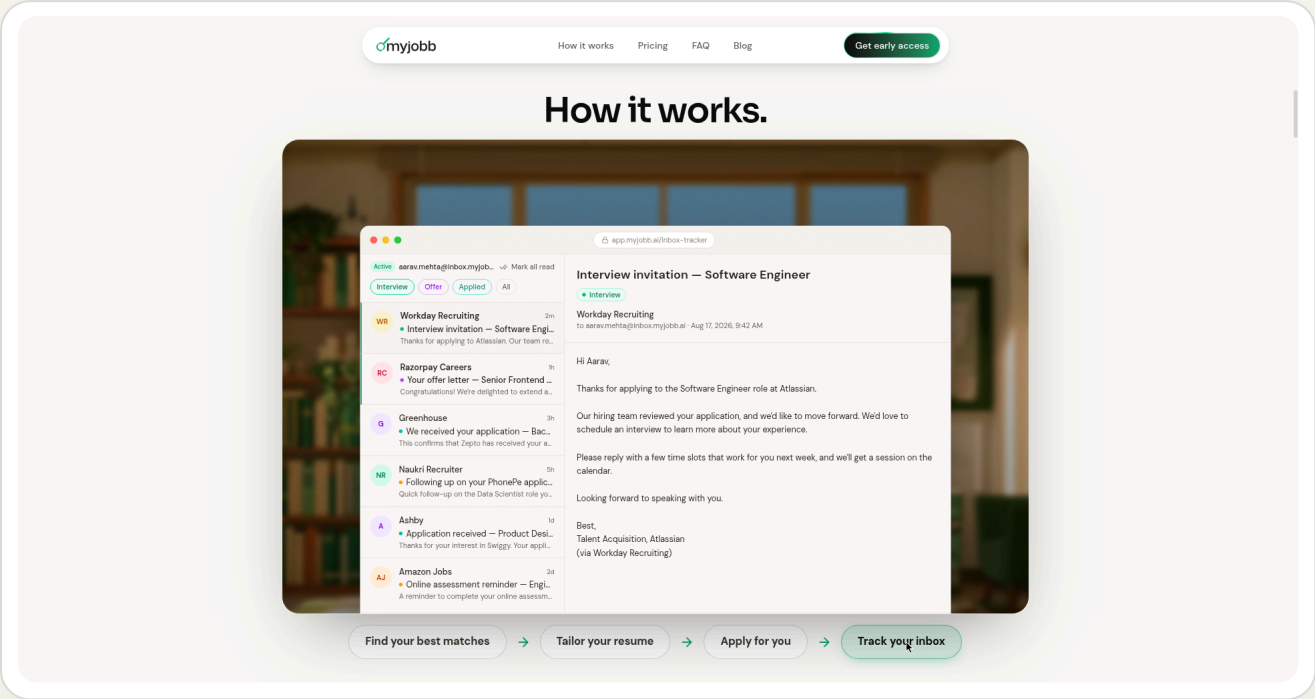

UI reading

- Timestamped actions support auditability.
- Approval precedes submission.
- Provenance badges are a meaningful trust pattern.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

Recruiter responses are pulled into the same loop.

The managed inbox groups messages and application states, reducing the context-switching that normally follows multi-board applications.

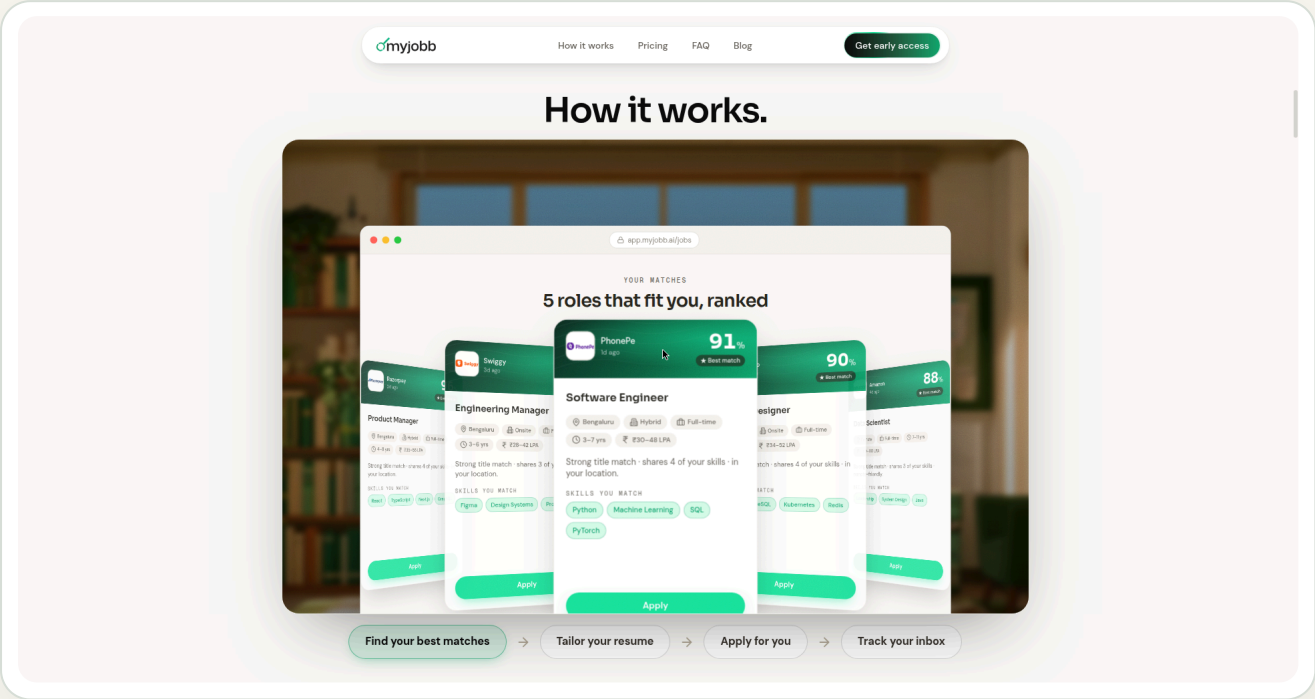

UI reading

- Inbox Tracker is part of the core app IA.
- Interview, Offer, and Applied tags are promised.
- Sources include ATS and job-board mail.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

WhatsApp extends the same approval loop beyond the web app.

The supplied capture shows the ranked-matches tab rather than the WhatsApp block. Public copy nevertheless positions WhatsApp as the control plane for approvals, questions, and status updates.

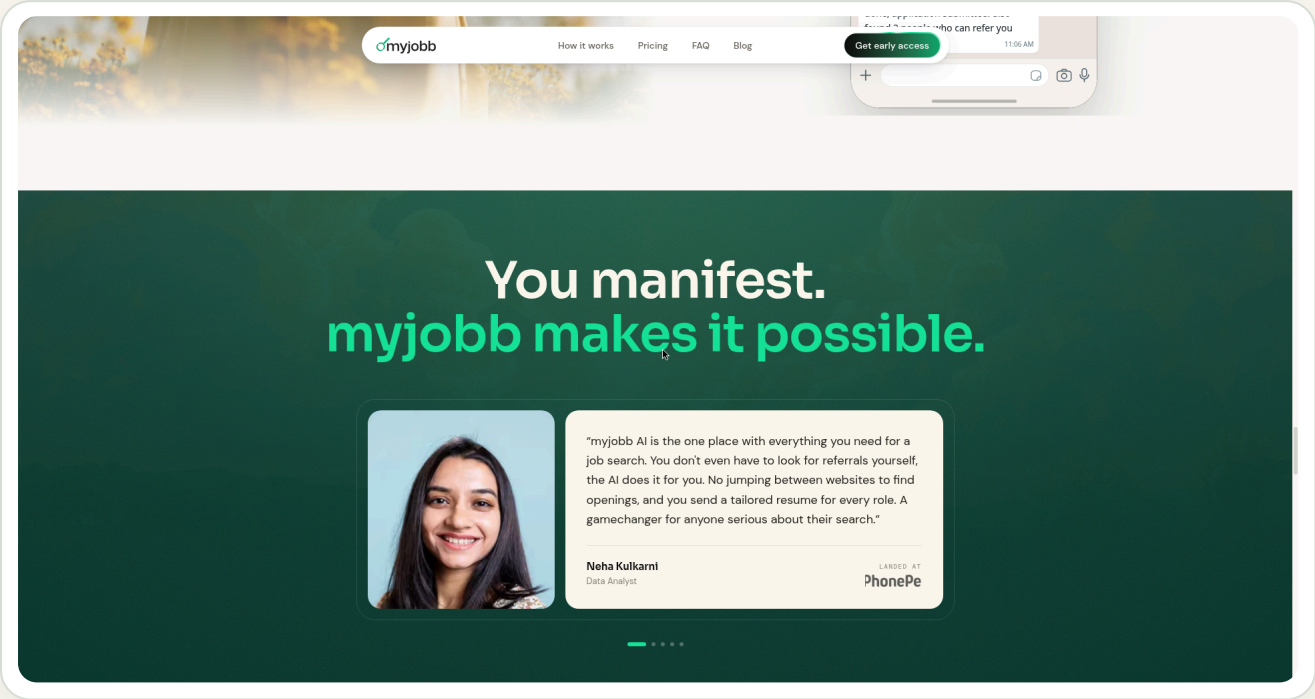

UI reading

- The capture does not visually verify the WhatsApp UI.
- E2E-encrypted chat is claimed.
- Low-confidence questions can be escalated.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

Social proof carries scale, but not verification.

Testimonial cards and hired-at logos make the product feel established. The stated usage numbers could not be independently validated from the outside.

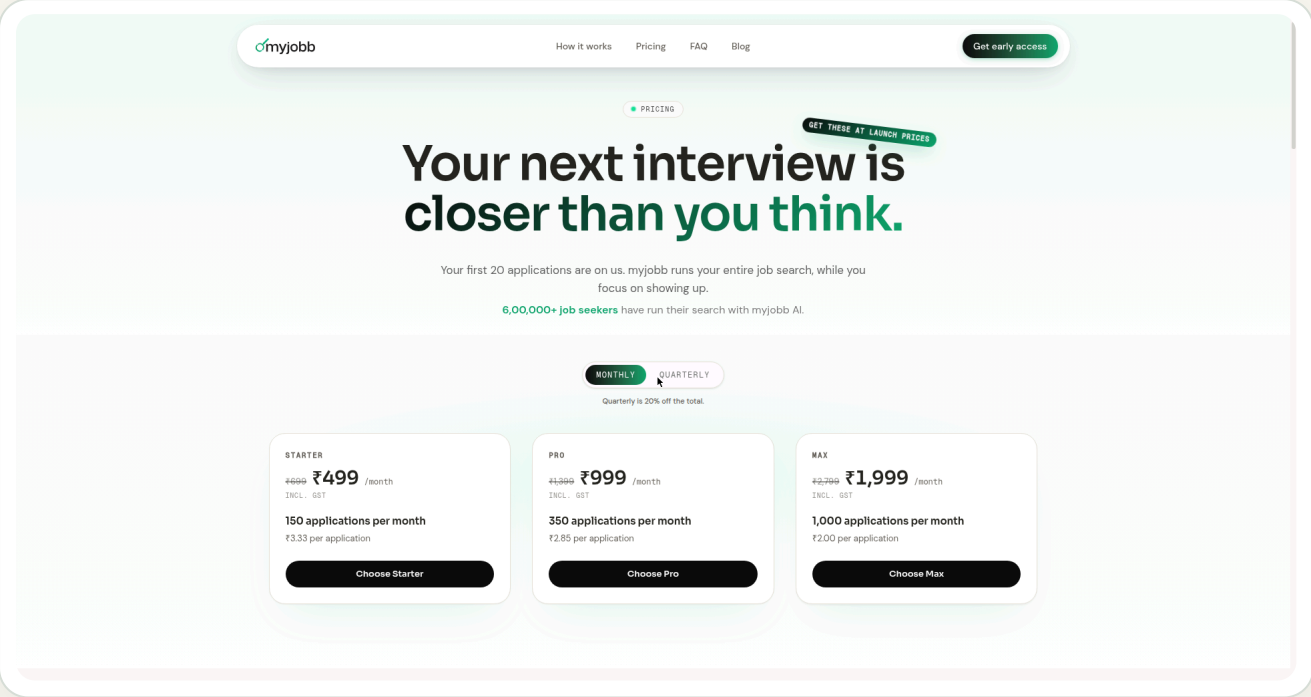

UI reading

- Claims include 1M+ and 6,00,000+ jobseekers.
- Logos shown include Amazon, JPMorgan, McKinsey, Swiggy, Zepto, Razorpay, and Emergent.
- Treat these as marketing claims.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

The pricing UI is simple; the underlying offer is not.

Three prepaid tiers differ mainly by application volume. The card design is clear, but other pages describe different prices and entitlements.

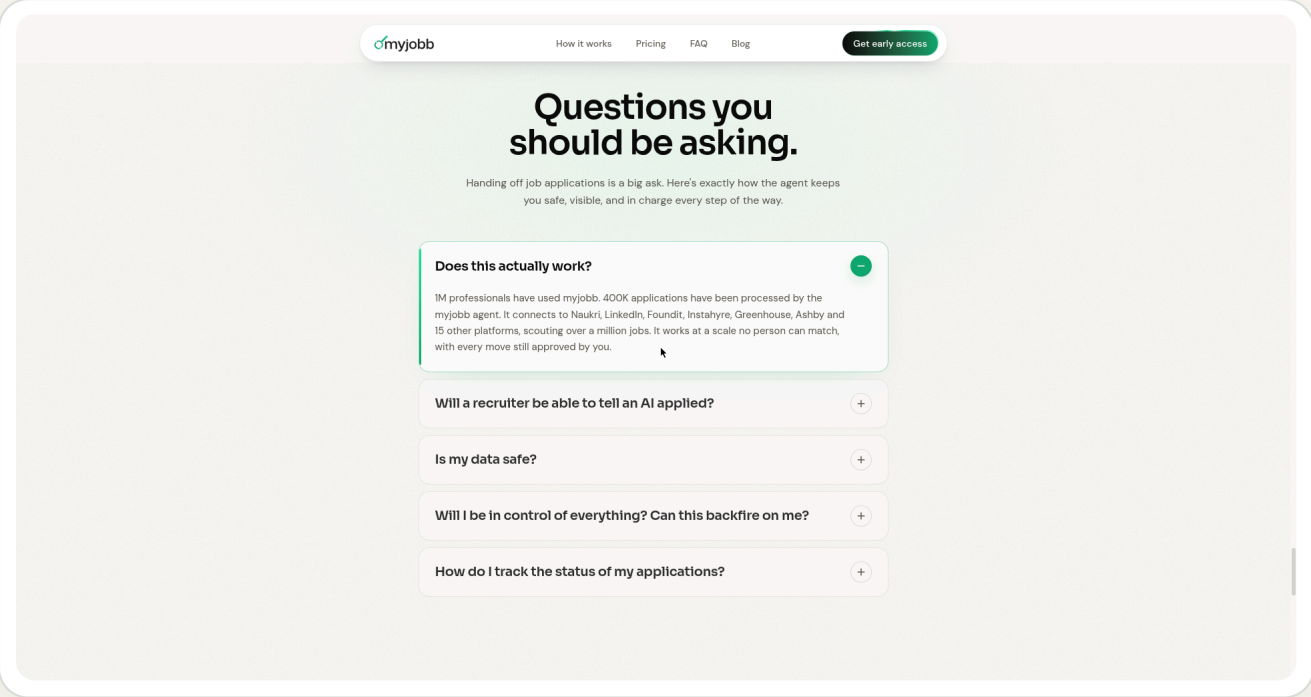

UI reading

- Launch prices include GST.
- Quarterly billing advertises 20% off.
- No auto-renew and no rollover are stated here.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

The footer is playful, useful, and slightly unconventional.

The signoff says “Wake up hired. tired,” with tired struck through. “Ask your LLM about myjobb AI” links to Claude, Gemini, ChatGPT, and Perplexity as a trust/SEO touch.

UI reading

- The /faq route redirects to the homepage.
- All observed blog posts shared one date, giving a seeded feel.
- Footer extends discovery into AI answer engines.

Design note

Cream and off-white surfaces keep the site approachable; deep green provides authority; bright lime is used sparingly for momentum and conversion.

Onboarding begins with extraction, then asks the user to narrow.

1 · Your story

Upload a PDF resume or paste a LinkedIn URL. Parsing takes about four seconds and silently prefills roles, skills, and locations. Status copy: “Reading roles, skills, and locations…”

2 · Target roles

Select the top three job titles. Suggested titles are prefilled from the resume.

3 · Skills

Choose up to five extracted skill chips and set total years of experience with a stepper.

Good interaction pattern

The wizard converts an unstructured resume into constrained, editable inputs rather than asking the candidate to start from zero.

The final step asks for far more trust than the first five.

4 · Where

Choose city chips - Bengaluru, Delhi NCR, Gurugram, Noida, Delhi, Mumbai, Pune, Hyderabad, Chennai, Kolkata, Ahmedabad - or select remote.

5 · Compensation

Enter current cost to company (CTC), mark fresher if relevant, and set expected CTC.

6 · Last details

Choose tailoring style: Off, Honest, or Aggressive. Add passport/work authorization for India, US, and Canada; postal address; work mode; relocation; start date; optional GitHub or portfolio; gender; disability status; and a password for the provisioned job inbox.

Trust friction

Full address, gender, disability status, and a job-boards password are required before the dashboard demonstrates value. No “skip for now” path was observed.

The product demands commitment before it reveals the product.

MANDATORY TEST DRIVE

One real application stands between onboarding and the dashboard.

The example offered was AI/ML Engineer at Logic Information Systems in Hyderabad through Workday. There was no skip button.

01 **Reading the role**

02 **Tailoring your resume**

Load profile → pull keywords → draft → score → patch → rescore → render PDF

03 **Applying on your behalf**

Stopped at “Let’s Apply.”

75/100

ATS score on tailored preview

Outcome

The user declined the real submission. No application was sent, and the dashboard remained locked.

Matching is explainable; automation is bounded and auditable.

score = clamp(1 + Σ deductions, 0, 1) × freshness

Skills	Recency	Compensation	Location
40%	20%	20%	20%

AI job matching

- Skills use inverse-document-frequency weighted overlap.
- Recency uses e^(−days/14).
- Every match exposes a deductions ledger.
- Feed claims 500K+ live jobs and 50K+ additions daily.

Auto-apply

- Chrome extension captures session cookies once.
- AES-256-GCM vault; “cookies, never passwords” is claimed.
- Nightly server-side runs with a daily cap from 1 to 25.
- A 9:00 AM IST report summarizes activity.

Screening answers

Typed fields draw from the profile; open questions are reasoned and assigned confidence. A low-confidence mandatory answer pauses the run.

Auditability

Each application keeps a timestamped timeline so the candidate can see exactly what happened and when.

The strongest features share context instead of acting as tools.

ATS resume builder

One master profile becomes a role-specific LaTeX PDF in roughly 10–20 seconds. The seven stages are: parse the job description, rank keywords, rewrite bullets, quantify impact, enforce ATS structure, render LaTeX, and score against 16 ATS engines.

Deterministic rubric

The score emphasizes keyword coverage, quantified bullets, action verbs, and structure. This is more credible than presenting a single unexplained “AI score.”

Referral finder

Uses Google’s public index rather than LinkedIn scraping. It ranks 5–10 employees and drafts a three-line LinkedIn request plus a 40–60-word internal pitch.

Reply-likelihood signals

Alma mater 3.4× · former company 3.7× · hometown 2.1× · same surname plus city 3.2×. These are product-stated multipliers, not independently validated.

Why this matters

Resume generation and referral discovery are connected to the same job object, so each action inherits role, company, and profile context.

Outreach and automations extend the agent beyond application forms.

Cold email sequence

A five-step, branching Gmail flow: Day 0 opener using a “Re:” subject, Day 1 continuation/reframe, Day 3 value-add, and Day 3 graceful bow-out. It auto-stops on reply and offers six tones.

Send optimization

The product names Tuesday–Thursday at 10:05 IST as its best send window. This is a product claim rather than verified performance data.

Automations canvas

A Figma-style node graph connects Job Source → platform branch → tailored resume → apply → referrals → cold email. Recipes include Nightly hunt, Referral storm, and Resume refresh.

Execution model

Cron schedules can run as often as every 30 minutes. Run history is replayable, with timing shown at each node.

A Source

B Branch

C Tailor

D Apply

E Outreach

The communication layer closes the loop, but was not live-tested.

Managed inbox

Promised tags include Interview, Offer, and Applied. It aggregates recruiter mail from Workday, Greenhouse, Ashby, Naukri, and Amazon Jobs.

WhatsApp agent

Used for approvals, screening questions, and status changes. End-to-end encryption is claimed.

What was actually seen

Public mockups and feature-page explanations establish the intended behavior and UI model.

What remains unverified

The real inbox list, tracker states, referral results, cold-email composer, automation canvas, and settings were inaccessible behind the live-application gate.

Do not confuse mockup coverage with product verification.

The report distinguishes observed public UI and completed onboarding from dashboard features that were described but not entered.

The cards are clean. The commercial truth is fragmented.

Starter

₹499

/ month

150 applications

Pro

₹999

/ month

350 applications

Max

₹1,999

/ month

1,000 applications

Launch pricing includes GST. First 20 applications are free with no card. Quarterly billing is shown at 20% off. Plans are prepaid, do not auto-renew, and unused applications do not roll over. Features are otherwise presented as identical.

Three incompatible offers appear publicly.

- Homepage: ₹999/month after 20 free applications, with “cancel the day you get hired.”
- Pricing page: Starter ₹499 / Pro ₹999 / Max ₹1,999, no auto-renew.
- Auto-apply page: Free ranked feed / Plus ₹499 for 100 auto-applies / Pro ₹1,999 unlimited with cold email and automations.

Until clarified, “cancel” effectively means do not renew - not cancel an active subscription.

The interface feels warm; the onboarding feels extractive.

Design language

Playful-modern software as a service: serif display headlines with italic green emphasis, off-white and cream fields, deep-green contrast sections, lime calls to action, rounded cards, soft shadows, and a sunflower-field illustration motif.

Strongest marketing asset

The four-tab “How it works” block uses convincing app mockups in browser frames. It reveals the intended IA: Jobs, Resume, Applications, and Inbox Tracker.

Strongest product pattern

The agent activity panel narrates every step, while the score ledger and answer provenance explain why the system acted.

Weakest trust pattern

Mandatory sensitive fields and a forced real application appear before the user can inspect the actual dashboard.

Clear

visual hierarchy

Visible

automation state

Costly

trust request

Most problems are not visual; they are expectation mismatches.

Navigation friction

- No Login link in the main nav; only “Get early access.”
- The /faq route redirects to the homepage.
- Every observed blog post carried the same date.

Proof friction

- “Trusted by 1M+,” “6,00,000+ jobseekers,” “1M+ professionals,” and “400K+ applications sent” could not be verified externally.
- Hired-at logos imply outcomes but do not establish attribution.

Onboarding friction

- No deferral for full address, gender, disability, or password setup.
- Tailoring labels “Honest” and “Aggressive” need clearer policy explanation.
- A real application is required before dashboard access.

Commercial friction

- Three incompatible pricing/entitlement presentations.
- “Cancel” conflicts with prepaid, no-auto-renew language.
- The free-to-paid boundary is difficult to predict.

Small but smart trust/SEO touch

The footer’s “Ask your LLM” links send users to Claude, Gemini, ChatGPT, and Perplexity to continue researching the brand.

The report preserves the line between observed and advertised.

ACCESS BOUNDARY

The teardown stopped exactly where real-world consequences began.

Because the user declined the mandatory test application, no job was submitted and no purchase or job-board connection was made.

Verified directly

Public marketing pages, Google-only sign-in, full six-step onboarding, resume parsing, test-drive flow, tailored resume preview, 75/100 ATS gauge, and the final “Let’s Apply” control.

Not verified in the live product

Dashboard, application tracker, inbox tracker, referral interface, cold-email interface, automations canvas, settings, real submissions, and recruiter-open tracking.

Public feature pages were still useful for understanding intended behavior; they are reported as product claims, not live confirmations.

Strong enough to test. Not clear enough to trust blindly.

Recommendation: test cautiously, not automatically.

myjobb.ai is worth a controlled trial because its explainable matching, role-specific resume pipeline, approval layer, and audit timeline solve real coordination pain. But do not enable broad automation until the trust gaps are resolved.

Correct every profile field	Especially address, experience, CTC, work authorization, and start date.
Get pricing in writing	Confirm the plan, application limit, add-ons, renewal, and rollover behavior.
Inspect the tailored resume	Check claims, keywords, dates, and the meaning of the chosen tailoring mode.
Submit one low-risk application manually	Use it only to evaluate the dashboard and audit trail.
Enable automation gradually	Start with a low daily cap and preserve approval on screening questions.

The product idea is strong. The next improvement is not more automation - it is earning the right to automate.
